

 **dinamik motor**

IE2 & IE3 SERIES

General purpose motors can be produced as 2-4-6 poles, 380 and 400V/50Hz for three-phase and 220V/50Hz and 230V/50Hz for single-phase. Special motors with special shafts, multi-speeds, various voltages and frequencies can be produced according to customer's requests.

Aluminum and cast iron frames are between 63-315, 0,12 kW - 200 kW. (Aluminum frame: 63 - 180. Cast iron frame: 160-315).

Their manufacturing and installation systems are IM B3, IM B5, IM B14 and B3/B5 (B35) and B3/B14 (B34) combined system format according to IEC 60034-7. Motors can also operate in vertical and appropriate installation positions.

Efficiency Class	: IE4, IE3, IE2, IE1
Cooling system	: IC411
Operation Type	: S1
Protection Class	: IP55
Working Height	: Maximum 1000 meters
Isolation class	: F
Temperature increase class	: B
Maximum ambient temperature for working	: 40°C

PTC thermistors in the windings are embedded in frame sizes 180 and bigger. PTC thermistors can be used in smaller sizes according to customer's request.

The voltages and frequencies for 2 and 4-pole, three-phase motors up to 3 kW and 6-pole, three-phase

motors up to 2,2 kW are 230 230VD/400VY 50 Hz. The voltages and frequencies for 2 and 4-pole, three-phase motors over 3 kW and 6-pole, three-phase motors over 2,2 kW are 400 VD/690VY 50 Hz.

Terminal boxes are made from aluminum alloy for three-phase motors and thermoplastic materials with capacitor slots for single-phase motors.

The standard position of the terminal box is on the upper part of the motors. Terminal boxes include six terminals for motor power supply. Grounding connection takes place in the terminal box. Additionally, there is a grounding connection in the motor frame.

Noise level is within IEC 60034-9 Standard.

Vibration intensity level is 'Normal' class according to 60034-14.

RAL 7031, gray colored, with single-component synthetic painting is standard and suitable for industrial environments. Upon customer's request different applications are possible.

VSD compatible motors can be produced upon customer's request.

 **dynamik motor**

DUTY TYPES

S1

Continuous running duty

Motor operates under fixed load until reaching heat balance. Without indications of the type of rated motor, S1 continuous running duty should be assumed. This is used in pump, fan, ventilation, and compressor applications.

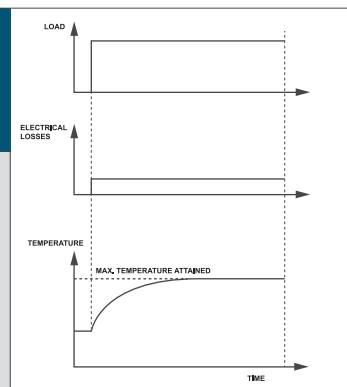

FIGURE 10: S-1 DUTY TYPE - Continuous running duty

S2

Short time duty

Motor operates under fixed load without reaching the heat balance. Motor cools down to ambient temperature in stop times. Operation time is recommended as 10, 30, 60 and 90 minutes. Dam covers, sirens and some cranes can be seen as examples of application.

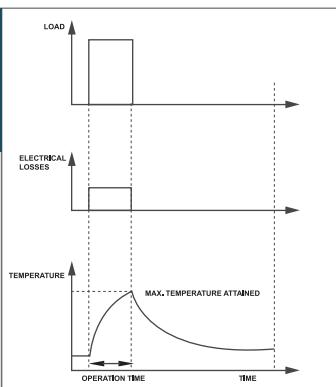

FIGURE 11: S-2 DUTY TYPE - Short-time duty

S3

Intermittent periodic duty not affected by the starting process

Operation periods are composed of a fixed load operation with a proceeding stop. Starting current does not cause temperature increase. Unless otherwise specified operation period is 10 minutes. Relative operation period can be 15%, 25%, 40% and 60% of the period. Motor valve systems and wire pulling machines are classified in S3 operation type.

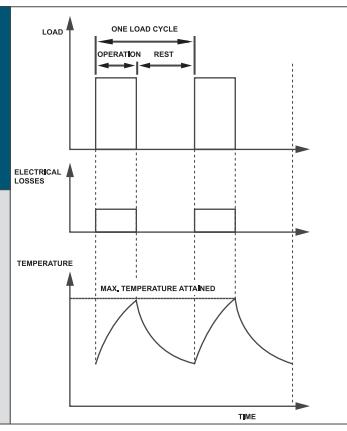

FIGURE 12: S-3 DUTY TYPE - Intermittent periodic duty

S4

Intermittent periodic duty affected by the starting process

This system is composed of identical operation period series. Each period has long starts, operating under a fixed load with stop periods that are not negligible. Due to very short operation periods, thermal balance cannot be reached. Overhead cranes, typical cranes, and elevators are examples of these types of applications.

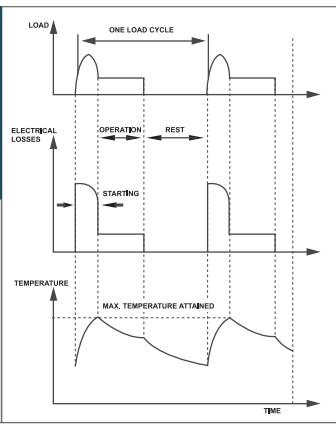

FIGURE 13: S-4 DUTY TYPE - Intermittent periodic duty with starting process

S5

Intermittent periodic duty affected by the starting process and by electric braking

This system is composed of an identical operation period series. Each period is composed of long starts, operating under a fixed load with instantaneous electrical braking and stop periods that are not negligible.

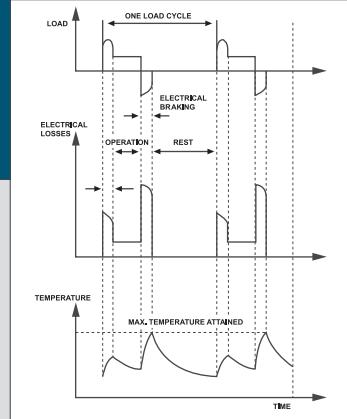

FIGURE 14: S-5 DUTY TYPE - Intermittent periodic duty with electric braking

S6

Continuous operation, periodic duty with intermittent load

This system is composed of an identical operation period series. Each period consists of two parts: one is operation under fixed load and the other is unloaded operation. Due to very short operation periods, thermal balance cannot be reached. Unless otherwise determined operation period is 10 minutes. Relative operation periods can be 15%, 25%, 40% and 60% of the period. Conveyors, machine tools and hand tools are covered in S6 operation type.

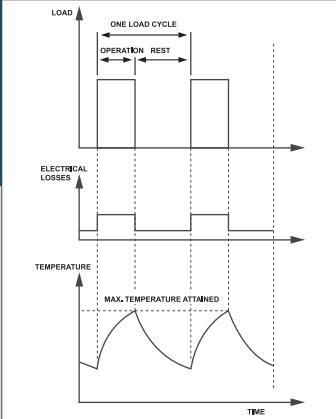

FIGURE 15: S-6 DUTY TYPE - Continuous operation duty with intermittent load

S7

Uninterrupted periodic duty, affected by the starting process and electric braking

This system comprises of a sequence of identical duty cycles. Each cycle has a period of starting current, a period of operation at constant load, and a period of electrical braking. The braking method is too short for thermal equilibrium to be obtained.

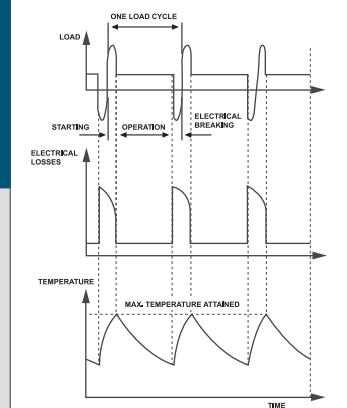

FIGURE 16: S-7 DUTY TYPE - Continuous operation periodic duty with electric braking

S8

Uninterrupted periodic duty with recurring speed and load changes

This system is a sequence of identical duty cycles, each period comprises of a period of operation at constant load (corresponding to a predetermined speed of rotation), and one or more periods of operation at other loads (corresponding to different speeds of rotation). The period of the duty cycle is too short for thermal equilibrium to be obtained. This type of duty cycle is used for pole changing motors. Applications which require different loads and different speeds are covered in S8 type operation

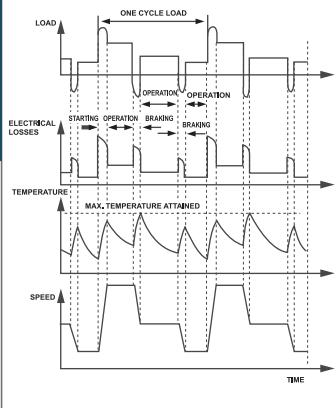

FIGURE 17: S-8 DUTY TYPE - Continuous operation periodic duty with related load/speed changes

PROTECTION CLASSES

Our motors are manufactured according to the IEC 60034-5 standard, protecting them against dust and squirting liquids. Our standard motors are manufactured in IP 55 protection class. IP56, IP65 and IP66 are available upon request.

As shown in Table 4, the first digit in the IP (Ingress Progress) diagram describes the protection against solid materials. The second digit shows the protection against liquid materials.

Protection Against Solid Materials	First Number	Second Number	Protection Against Liquid Materials
Unprotected	0	0	Unprotected
Protection against objects greater than 50 mm	1	1	Protection against water coming vertically
Protection against objects greater than 12 mm	2	2	Protection against water coming vertically up to 15 ° angle
Protection against objects greater than 2.5 mm	3	3	Protection against water coming vertically up to 60 ° angle
Protection against objects greater than 1 mm	4	4	Protection against water splashing from all directions
Protection against dust	5	5	Protection against water squirting from all directions
Complete protection against dust	6	6	Protection against powerful water squirting from all directions
	0	7	Protection against temporary water submersion between 0.15m and 1m
	0	8	Protection against permanent water submersion

TABLE 4: Protection Classes

MAIN COOLING TYPES ACCORDING TO IEC 60034-6

COOLING TYPE

The aim of cooling is to transfer the heat from the motor to ambient. The objective is to keep the temperature of isolation materials under the limit values.

The cooling type in Electrical Machines are determined with numbers between "1-9" that come after 'IC' (International Cooling), code letters according to the IEC 60034-6 standard.

Cooling air is supplied by a plastic fan which is connected to the motor shaft and operates inside a holed steel sheet protection cover; cooling is performed outside of the completely closed surface of the motor. Since Volt Electric motors are cooled with a fan from a completely closed outside surface, their cooling type is IC 411. IC 418 cooling type can also be manufactured upon special requests. Commonly used cooling examples for IEC 60034-6 standard are given in following Figure 18.

Cooling air is supplied by a plastic fan which is connected to the motor shaft and operates inside a holed steel sheet protection cover; cooling is performed outside of the completely closed surface of the motor.

FIGURE 18: Main Cooling Types According to IEC 60034-6

ISOLATION CLASSES

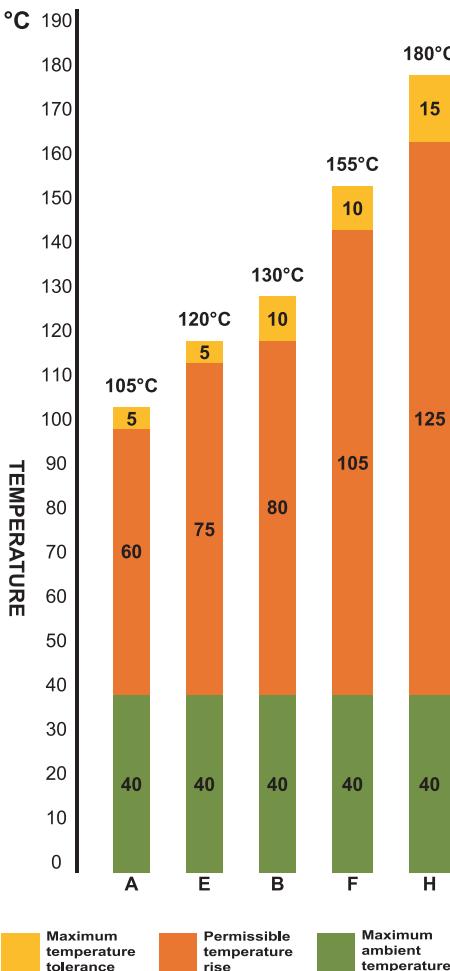

FIGURE 20: Isolation classes chart

Maximum Values that are permitted	Unit	Isolation Class					
		A	E	B	F	H	
Total winding temperature	($t_{ambient} + \Delta t + t_{tolerance}$)	°C	105	120	130	155	180
Winding temperature increase	(Δt)	K	60	75	80	105	125
Ambient Temperature	($t_{ambient}$)	°C	40	40	40	40	40
Tolerance	($t_{tolerance}$)	K	5	5	10	10	15

TABLE 10: Isolation classes

The temperature rise limit of Dinamik Motor is in class B. Stator windings are composed of copper conductors which are plated by double-layered enamel in class H. In phase windings (in each channel and in each winding start) and winding heads, complete isolation is provided by Lacquer absorption method which is high qualified and in class H (total 180 °C). Other isolation materials are also in class H. This enables a winding construction to stand up to 155 °C.

The classification of isolation materials based on their standing temperature are shown in Table 10.

There are also Y, 200, 220, 250 isolation classes according to IEC 60085. Y class defines 90 °C temperature limit, 200 class defines 200 °C limit, 220 class defines 220 °C limit and 250 class defines 250 °C temperature limit.

A graphical representation of above mentioned are shown in Figure 20.

VIBRATION LIMITS ACCORDING TO IEC 60034-14

Vibration Grade	Shaft Height (mm)	56 ≤ H ≤ 132			132 < H ≤ 280			H > 280		
		Mounting	Displac. µm	Vel. mm/s	Acc. m/s²	Displac. µm	Vel. mm/s	Acc. m/s²	Displac. µm	Vel. mm/s
A	Free Suspension	25	1,6	2,5	35	2,2	3,5	45	2,8	4,4
	Rigid Mounting	21	1,3	2,0	29	1,8	2,8	37	2,3	3,6
B	Free Suspension	11	0,7	1,1	18	1,1	1,7	29	1,8	2,8
	Rigid Mounting	-	-	-	14	0,9	1,4	24	1,5	2,4

TABLE 11: Vibration Limits according to IEC 60034-14

Grade "A" applies to machines with no special vibration requirements.

Grade "B" applies to machines with special vibration requirements. Rigid mounting is not considered acceptable for machines with shaft heights less than 132 mm. The interface frequencies for displacement/velocity and velocity/acceleration are 10 Hz and 250 Hz respectively.

VIBRATION LIMITS ACCORDING TO IEC 60034-14

Permitted vibration densities are determined in IEC 60034-14 standards and these values which are given in Table 11 are recommended as upper limit values for motor producers. Three separate vibration density levels are determined according to this standard. Vibration levels of Dinamik Motors are within normal limits and meet the standard provisions. All our rotors are dynamically balanced by half key.

Duty types:

Duty type is an operational program that covers unloaded operation and stop period; and the load applying order and periods.

Operation regime type is the operation system that does not change one or more loads for a definite time period. Electrical motors are manufactured according to operational conditions. Standard operational duty types are classified according to IEC 60034-1.

BEARINGS

BEARINGS THAT ARE USED in SINGLE-PHASE MOTORS

Fixed-ball bearing, whose both sides are closed (ZZ), are used in motors with frame sizes 63-132 (Figure 22) as well as frame sizes 160-225 (Figure 22).

In some cases construction can be made (as seen in Figure 23) for preventing axial movement of shaft with respect to some applications in frame sizes 63-132.

Rubber dust gaskets (V-ring) are placed in front and rear covers. Oil seal can be placed upon on request.

FRAME SIZE	POLE NUMBER	DE BEARING	NDE BEARING
63	2-4-6	6201 ZZ	6201 ZZ
71	2-4-6	6202 ZZ	6202 ZZ
